2005 MUG Meeting
October 27-28, 2005
Madison, WI

Review the Project

- Why?
 - Limitations of Mc-X data and displays
 - Heavy burden of platform dependencies
 - Approach?
 - Phase in capabilities
 - Allow most legacy Mc-X commands to work
 - Timeline?
 - Ideal: 4 people for 3 years
 - Reality (without up-front funding): 2 people for 6 years
-
-

Mc-V vs. Mc-X

- Platform dependencies
- Displays
- Controls
- Data types (hyperspectral, etc.)
- Plug-ins for unique needs of individual sites
- Site-defined GUIs
- Bundles

IDV – the “Reference Application”

- What is it?
 - Unidata Program Center's testbed
 - Designed to show and test everything that the IDV library can do
 - Community effort
 - Ever-changing & improving
 - Why using it today?
 - Little work done yet on Mc-V specific user interface
 - Illustrates a lot of capabilities – some of which might be exploited in Mc-V
-
-

Early Work on Mc-V

- Survey of current Mc-X users
 - “batch” processing to produce images and data
 - Combined UI for imagery from ADDE and/or OpenDAP/OpenGIS
 - Run legacy Mc-X commands and get georeferenced output into VisAD display
-
-

McIDAS Data Source

- What is it?
 - A bridge from the Mc-X display into the Mc-V world
 - A bit of C code, a lot of Java, and a bit of XML
 - How is it used?
 - Keeps track of updates to the Mc-X display and moves the contents to the IDV display in a timely manner
 - Allows access to the Mc-X frame directory for defining loops
 - Enhancements and graphics may be independently applied
-
-

What it Knows and Doesn't

- Frames (including images, navigation and graphics, and color tables) produced on Mc-X can be imported into Mc-V.
 - Mc-V has no other information about the frame content, such as calibration units or what a graphic represents (e.g., a map, PRE contours, etc.)
 - Only the part of an image that is displayed in the Mc-X frame is transferred to Mc-V (i.e., frames not areas).
 - All IDV/VisAD display functionality can be applied (pan, zoom, animate, rotate, color tables).
-
-

Let's Have a Look . . .

McIDAS-X Dynamic Import

- Image pixels
- Navigation
- Graphics
- Color Tables

McIDAS-X Static Import

- Individual frames
- Animated sequences

Multi-panel Displays

Independent

- Graphics
- Color tables
- Animation controls

Optionally linked

- Zoom and pan
- Projection

Combining Datasets

- Optional reprojection
- Independent display controls
- Independent on/off toggles

“F Key” Functionality

- Multi-view display
- Bundles
- Toolbar items

Conceptual Differences

- Frames
 - VisAD deals with “time” as just another dimension
 - Bundles
 - IDV's way of quickly getting a desired display
 - Can be used with scripted, cron-d, or UI
 - Scripting
 - Jython (Python for Java) chosen because it's easy to learn and use
 - Most Mc-X scripts nowadays are used to simply create a specialized display
-
-

Mc-V Timeline – Part One

(please ignore the absolute dates...)

Part Two

(please ignore the absolute dates)

Mc-V Budget

- \$1.3M total
 - \$145K received in an overhead grant from SSEC Directors to test the feasibility
 - Still seeking the rest for:
 - Programmer training
 - Program design and implementation
 - Testing
 - Documentation
 - Integration and distribution process
-
-
