

# Community Satellite Processing Package (CSPP) Cross-track Infrared Sounder (CrIS) Dual-Regression Retrievals and Applications

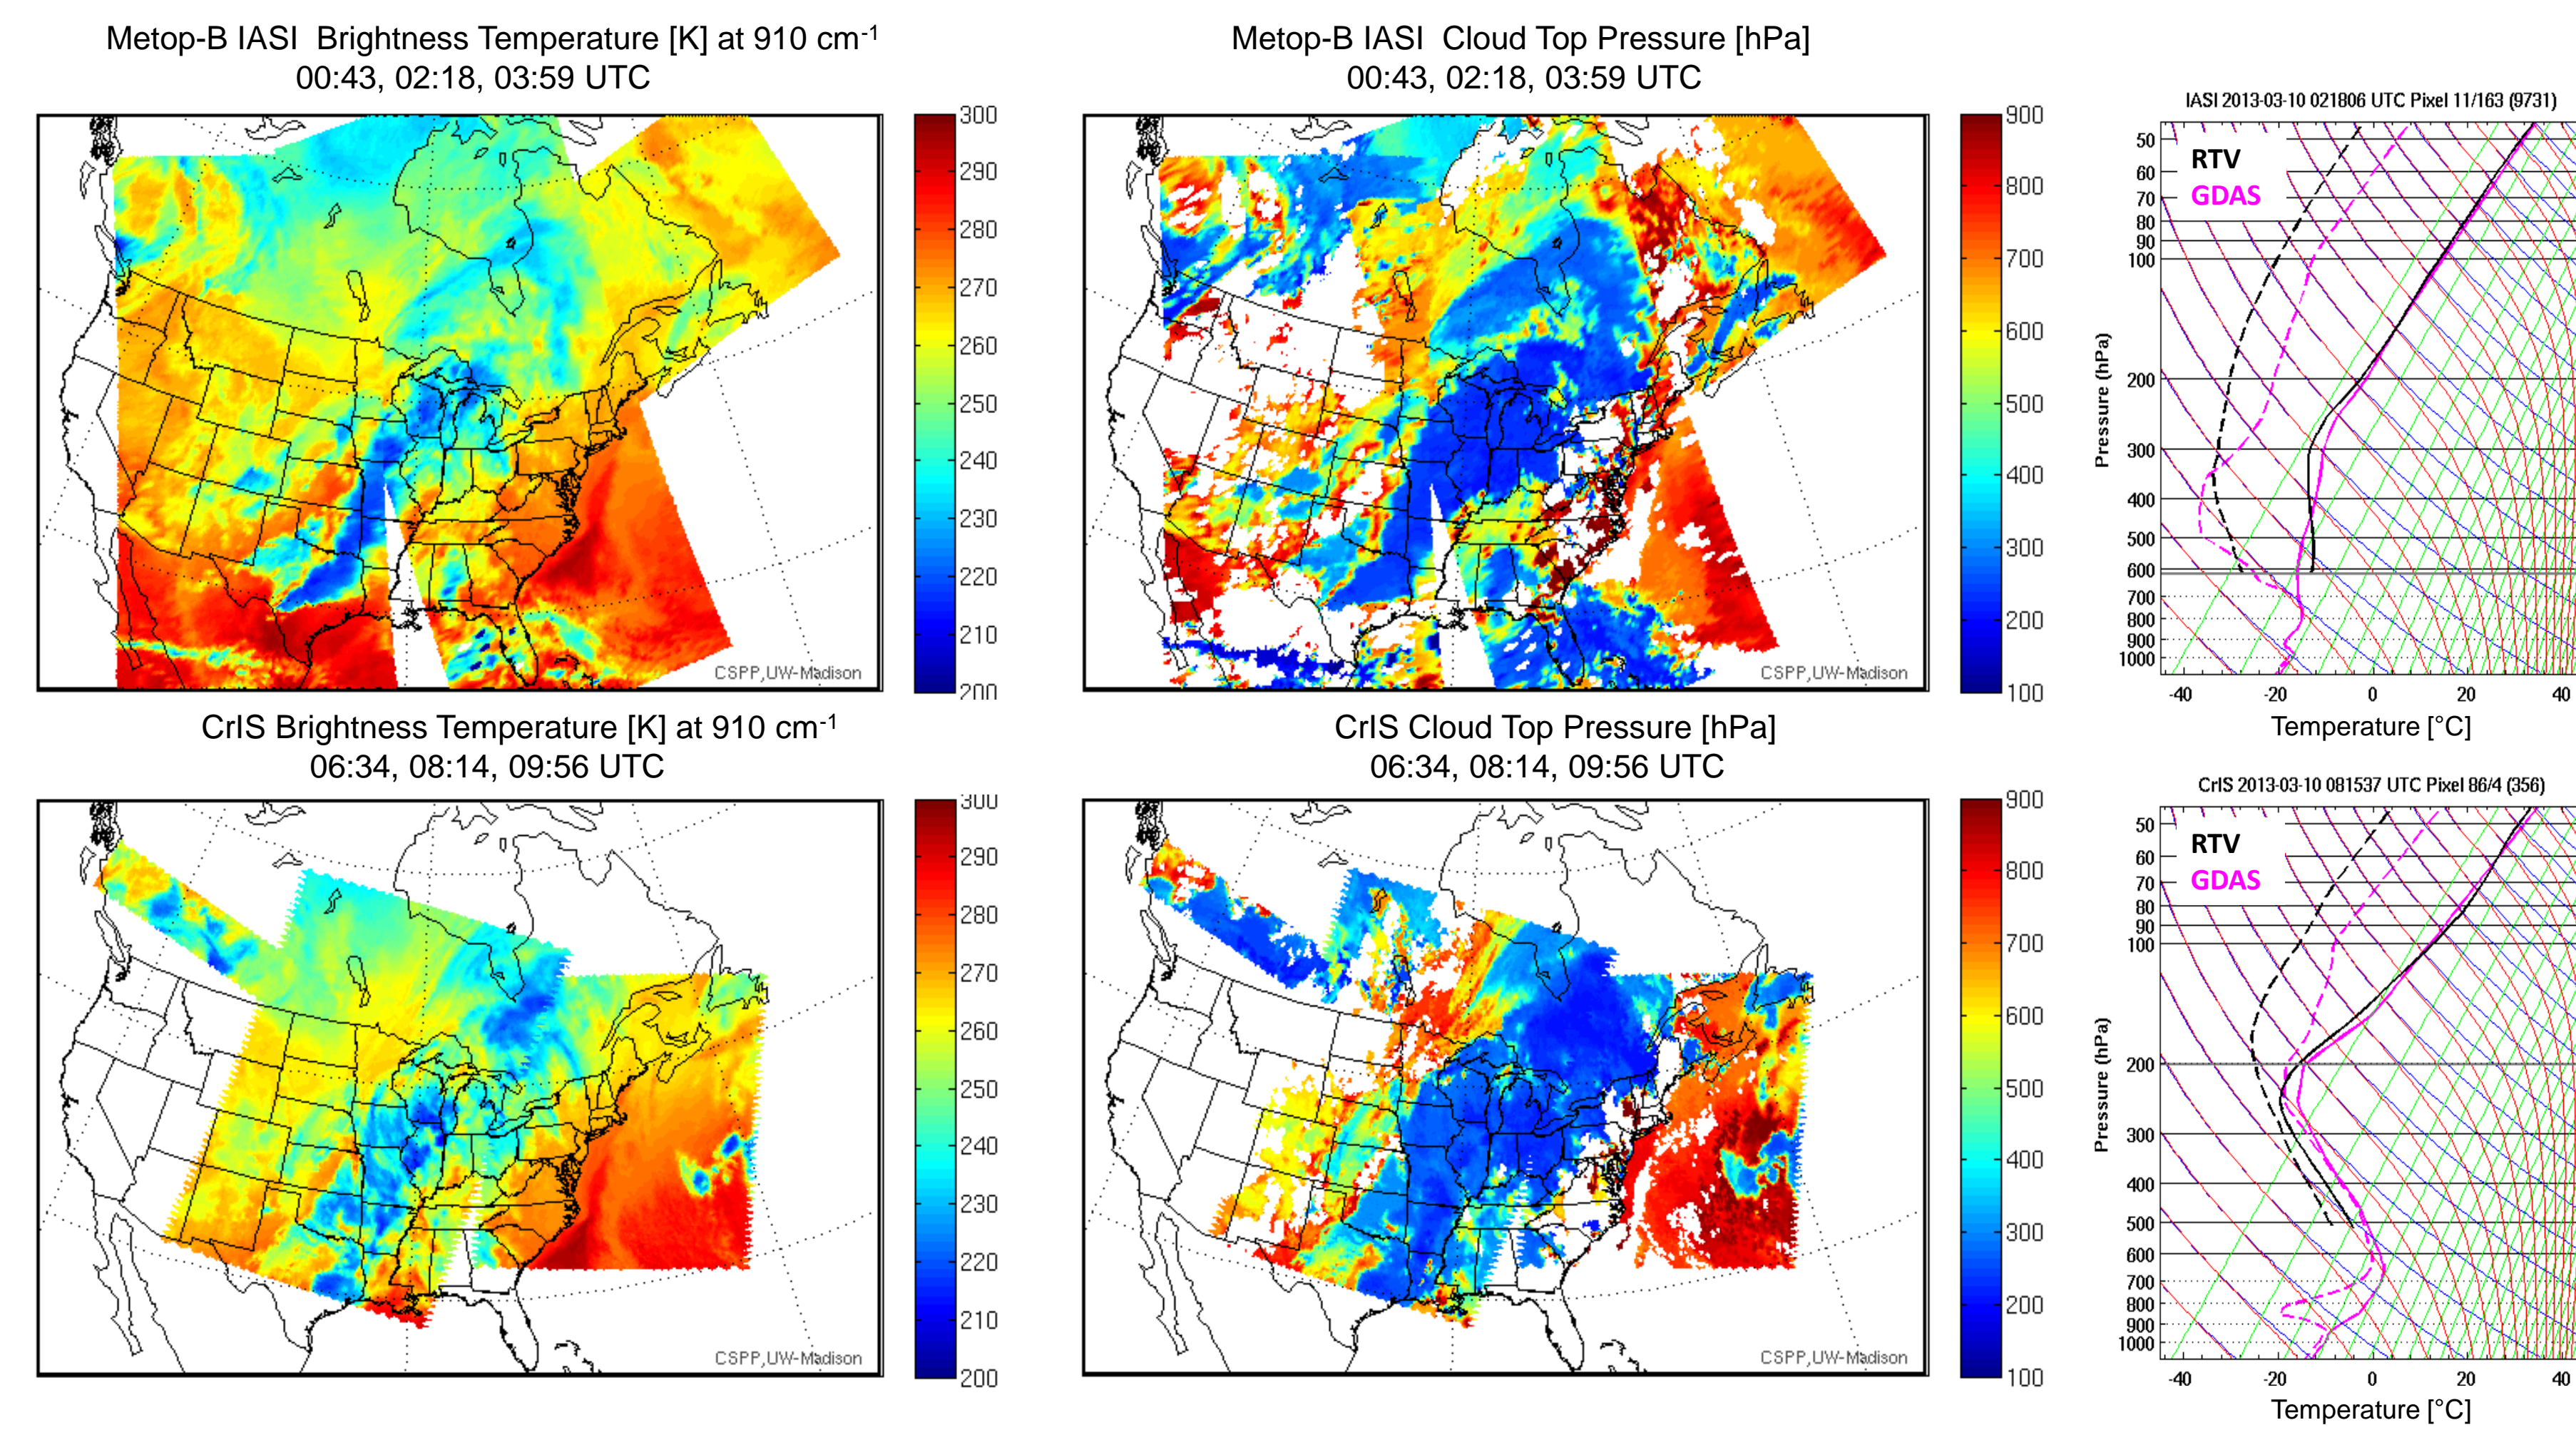

Elisabeth Weisz, William L. Smith Sr., Nadia Smith, Kathy Strabala, Liam Gumley, et al.

Space Science and Engineering Center/Cooperative Institute for Meteorological Satellite Studies, University of Wisconsin - Madison, U.S.A

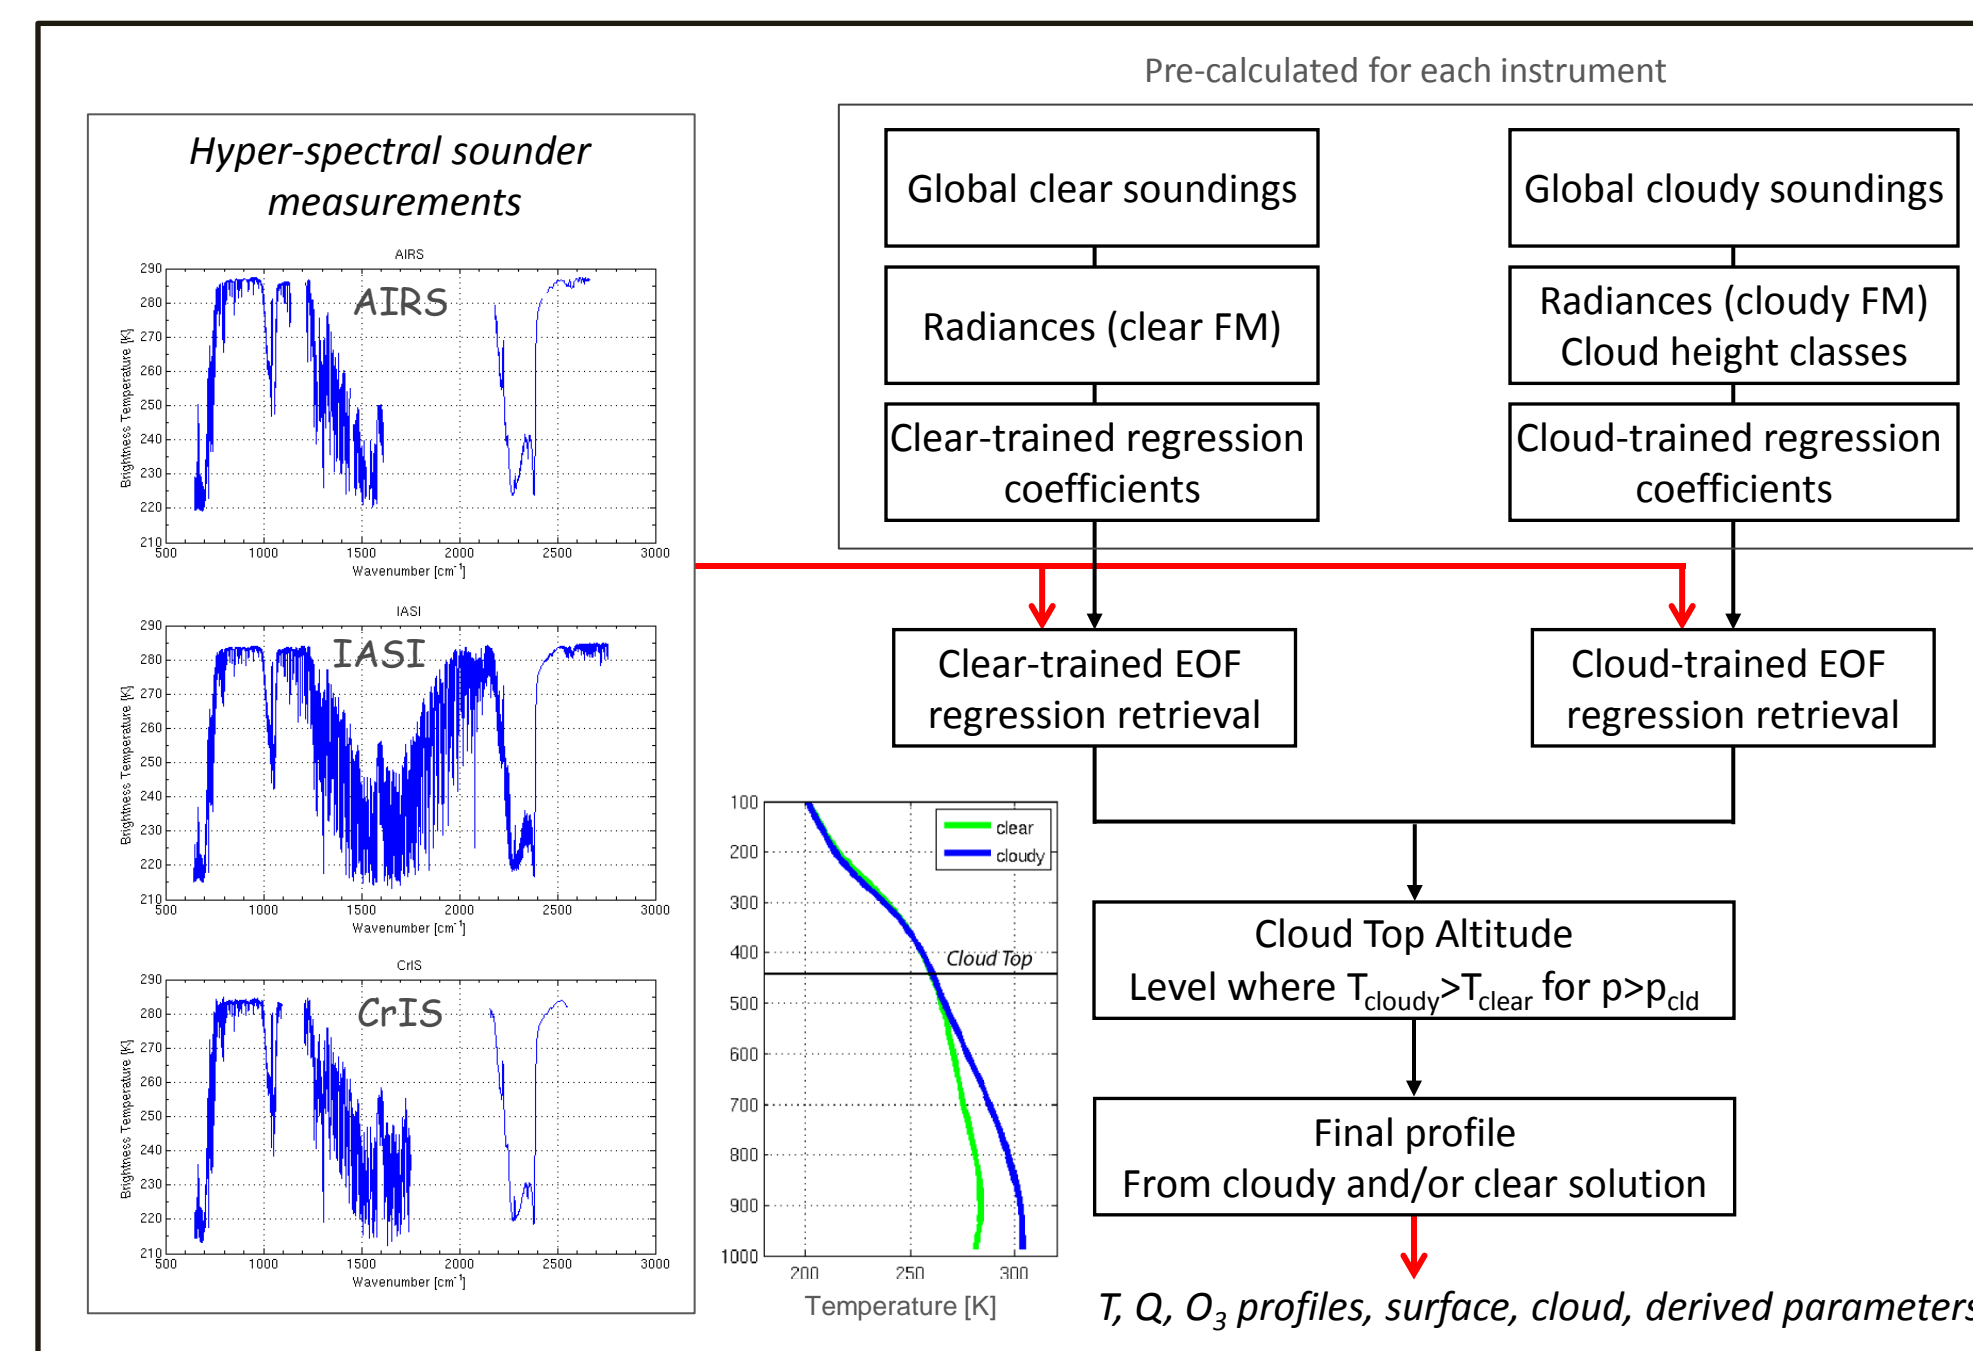

The Dual-Regression (DR) algorithm<sup>1,2</sup>, available as part of CSPP on <http://cimss.ssec.wisc.edu/cspp/>, provides single field-of-view products (temperature, humidity and ozone profiles, surface and cloud parameters, stability indices) under clear and cloudy conditions from input Direct Broadcast (DB) or archived AIRS (Atmospheric Infrared Sounder), IASI (Infrared Atmospheric Sounding Interferometer) and CrIS radiance measurements. Our science goals are to

- measure temperature trends, water cycle, cloud properties, and trace gases (regional and global)
- study time tendencies of atmospheric parameters (e.g. lifted index) from consecutive overpasses
- add quantitative information to MODIS/AVHRR/VIIRS imagery
- improve weather prediction, forecasting and climate models

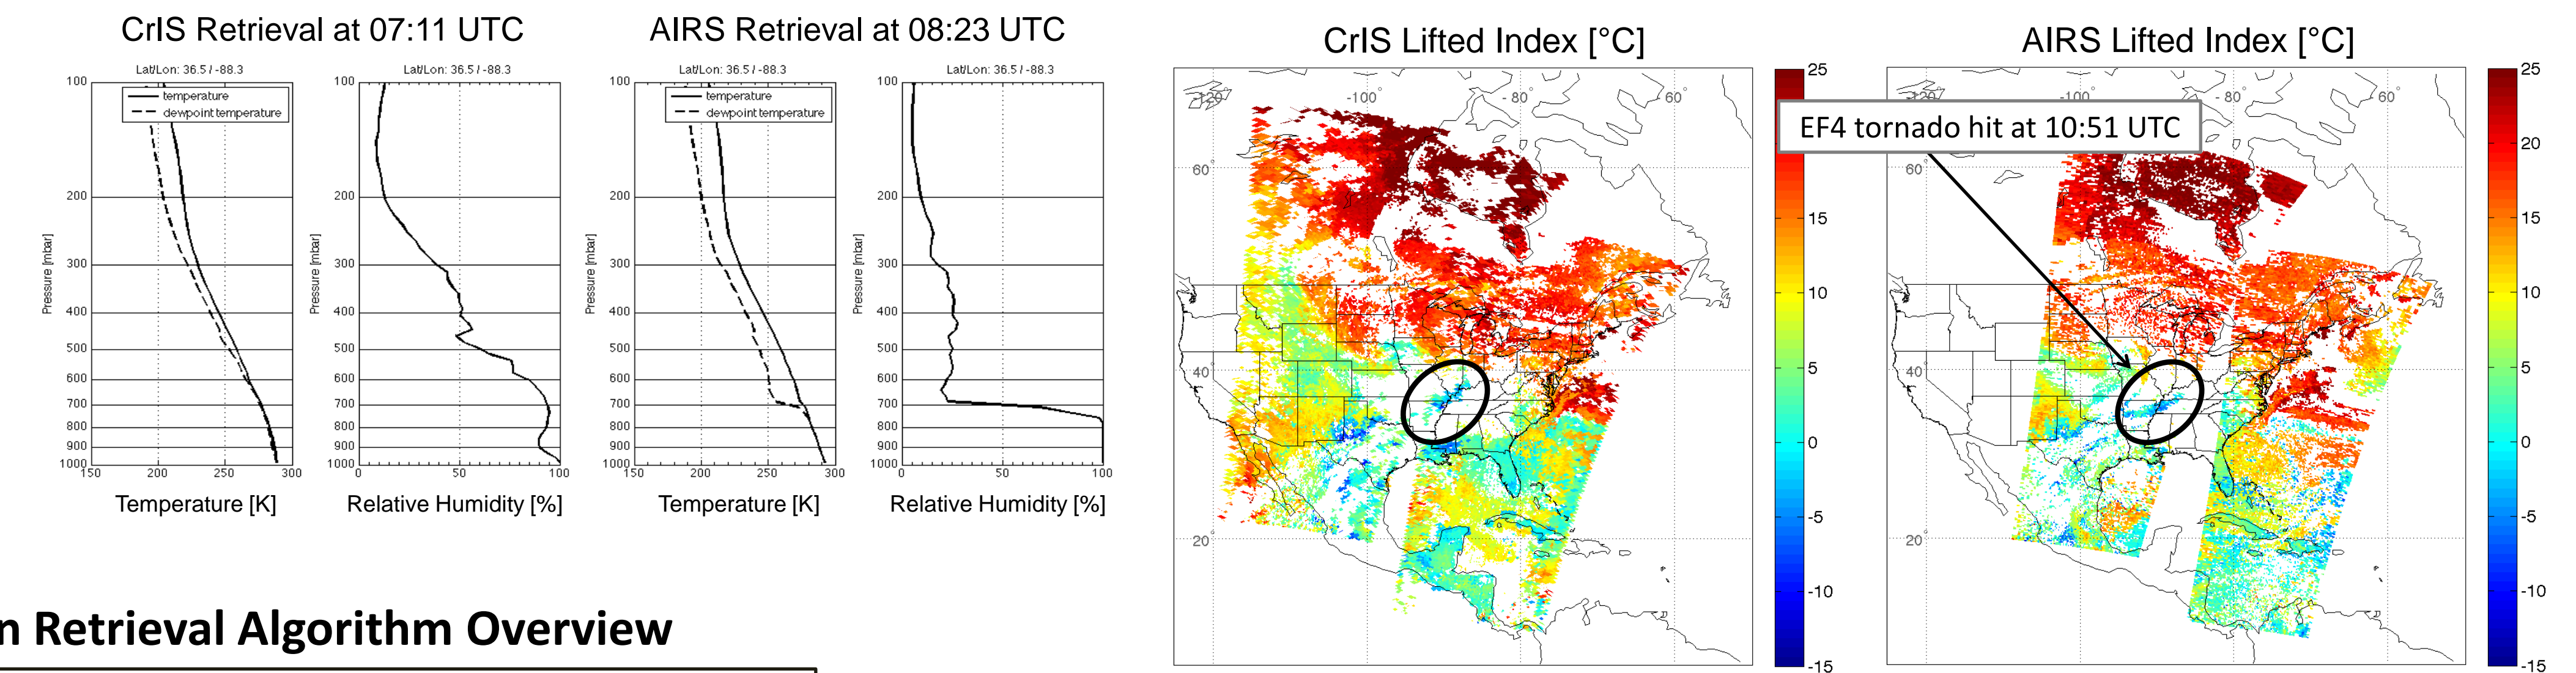

## Metop-B IASI and CrIS: Direct Broadcast over CONUS (10 March 2013)

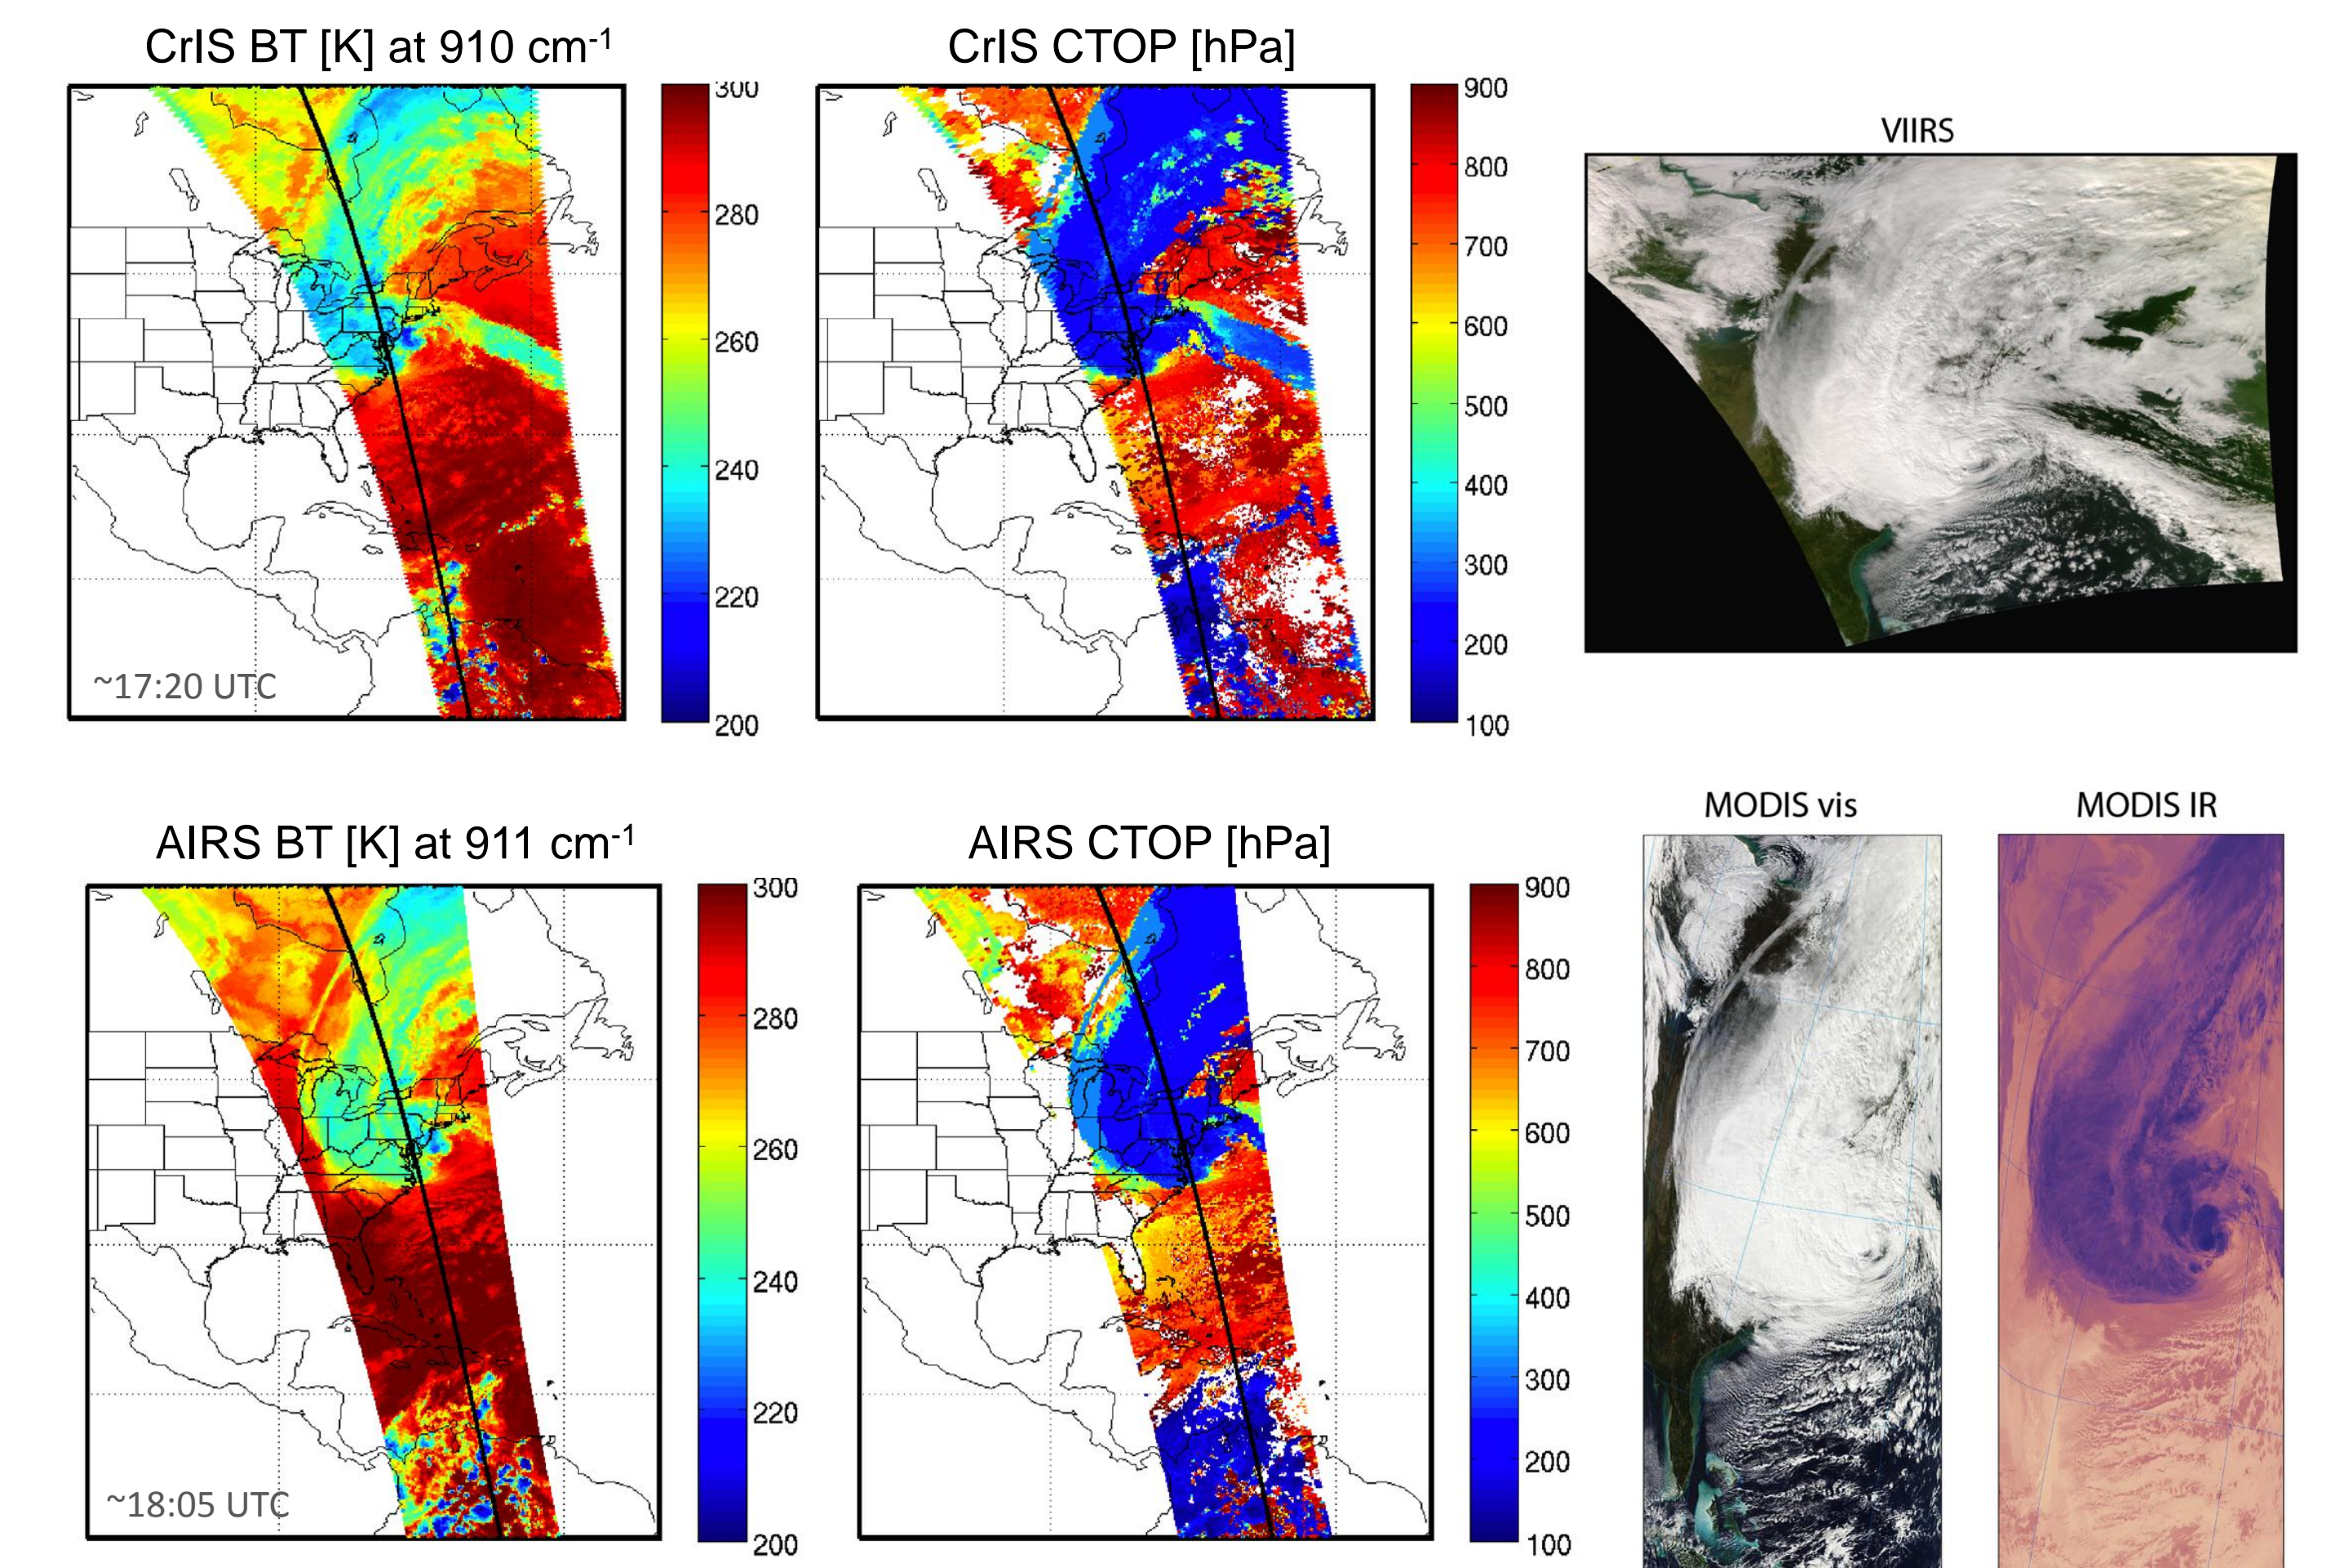

## Dual-Regression Retrieval Algorithm Overview

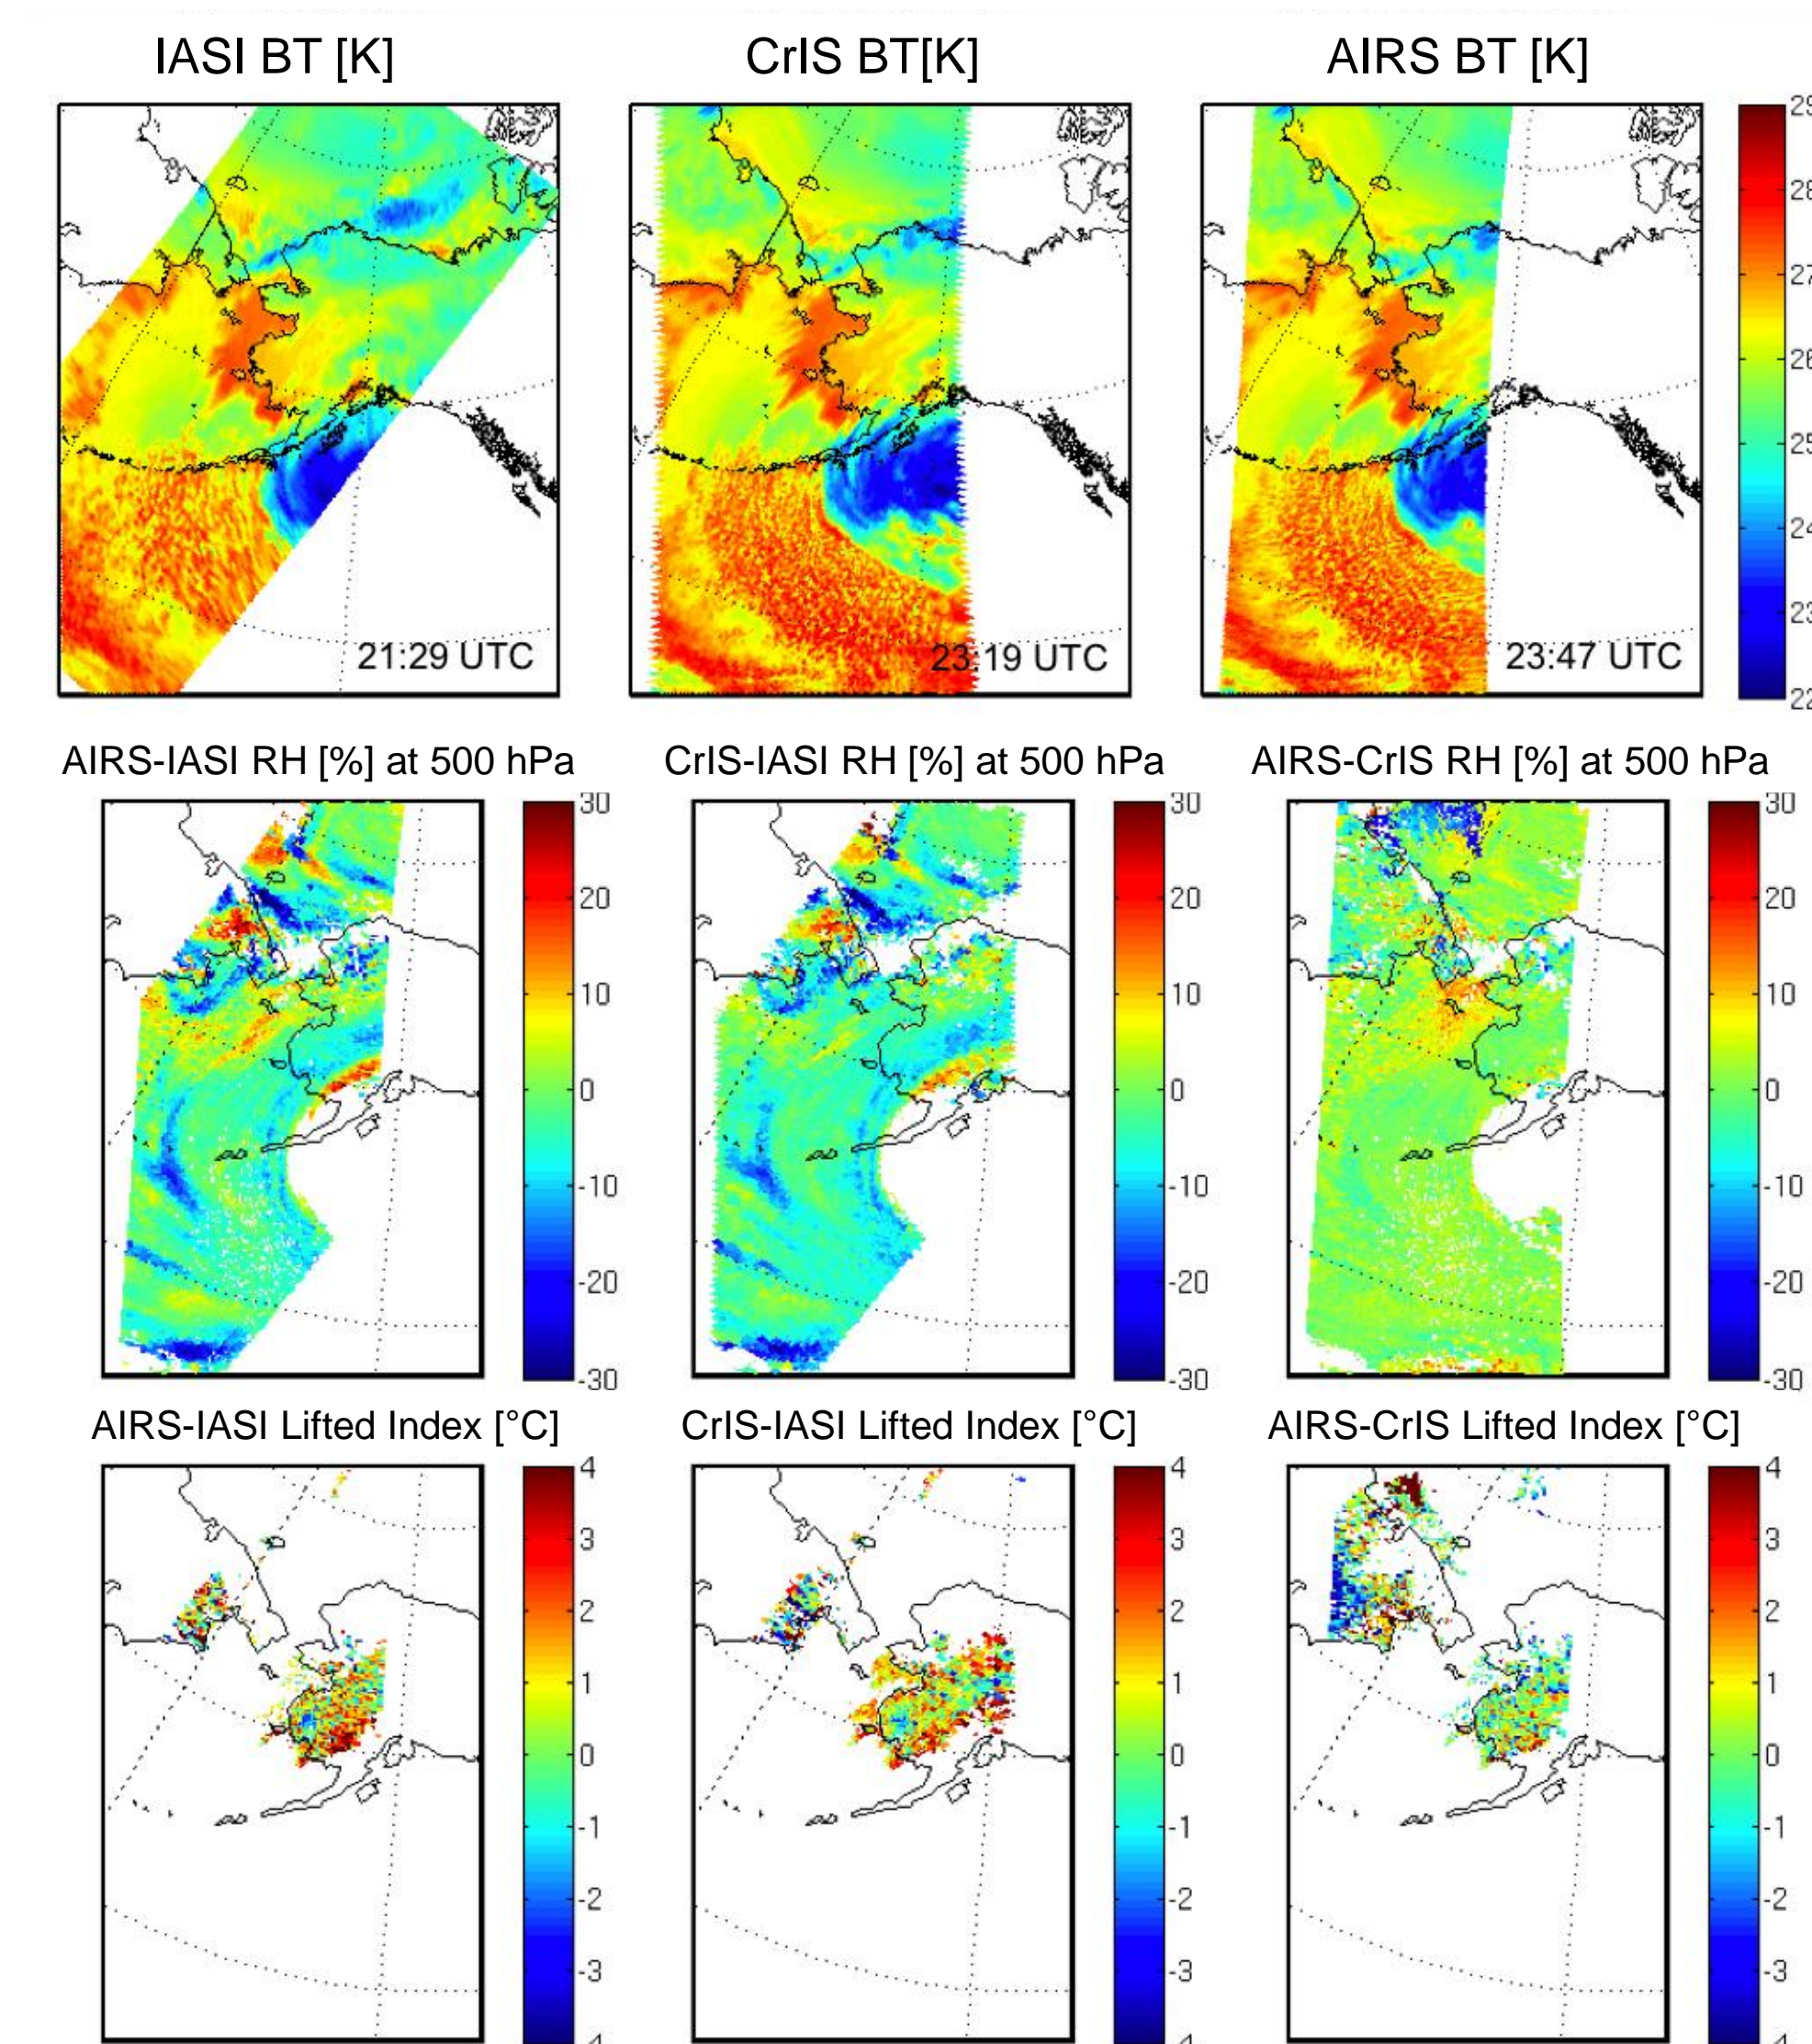

## CrIS and AIRS: Tornado Outbreak in U.S. Midwest (29 Feb 2012)

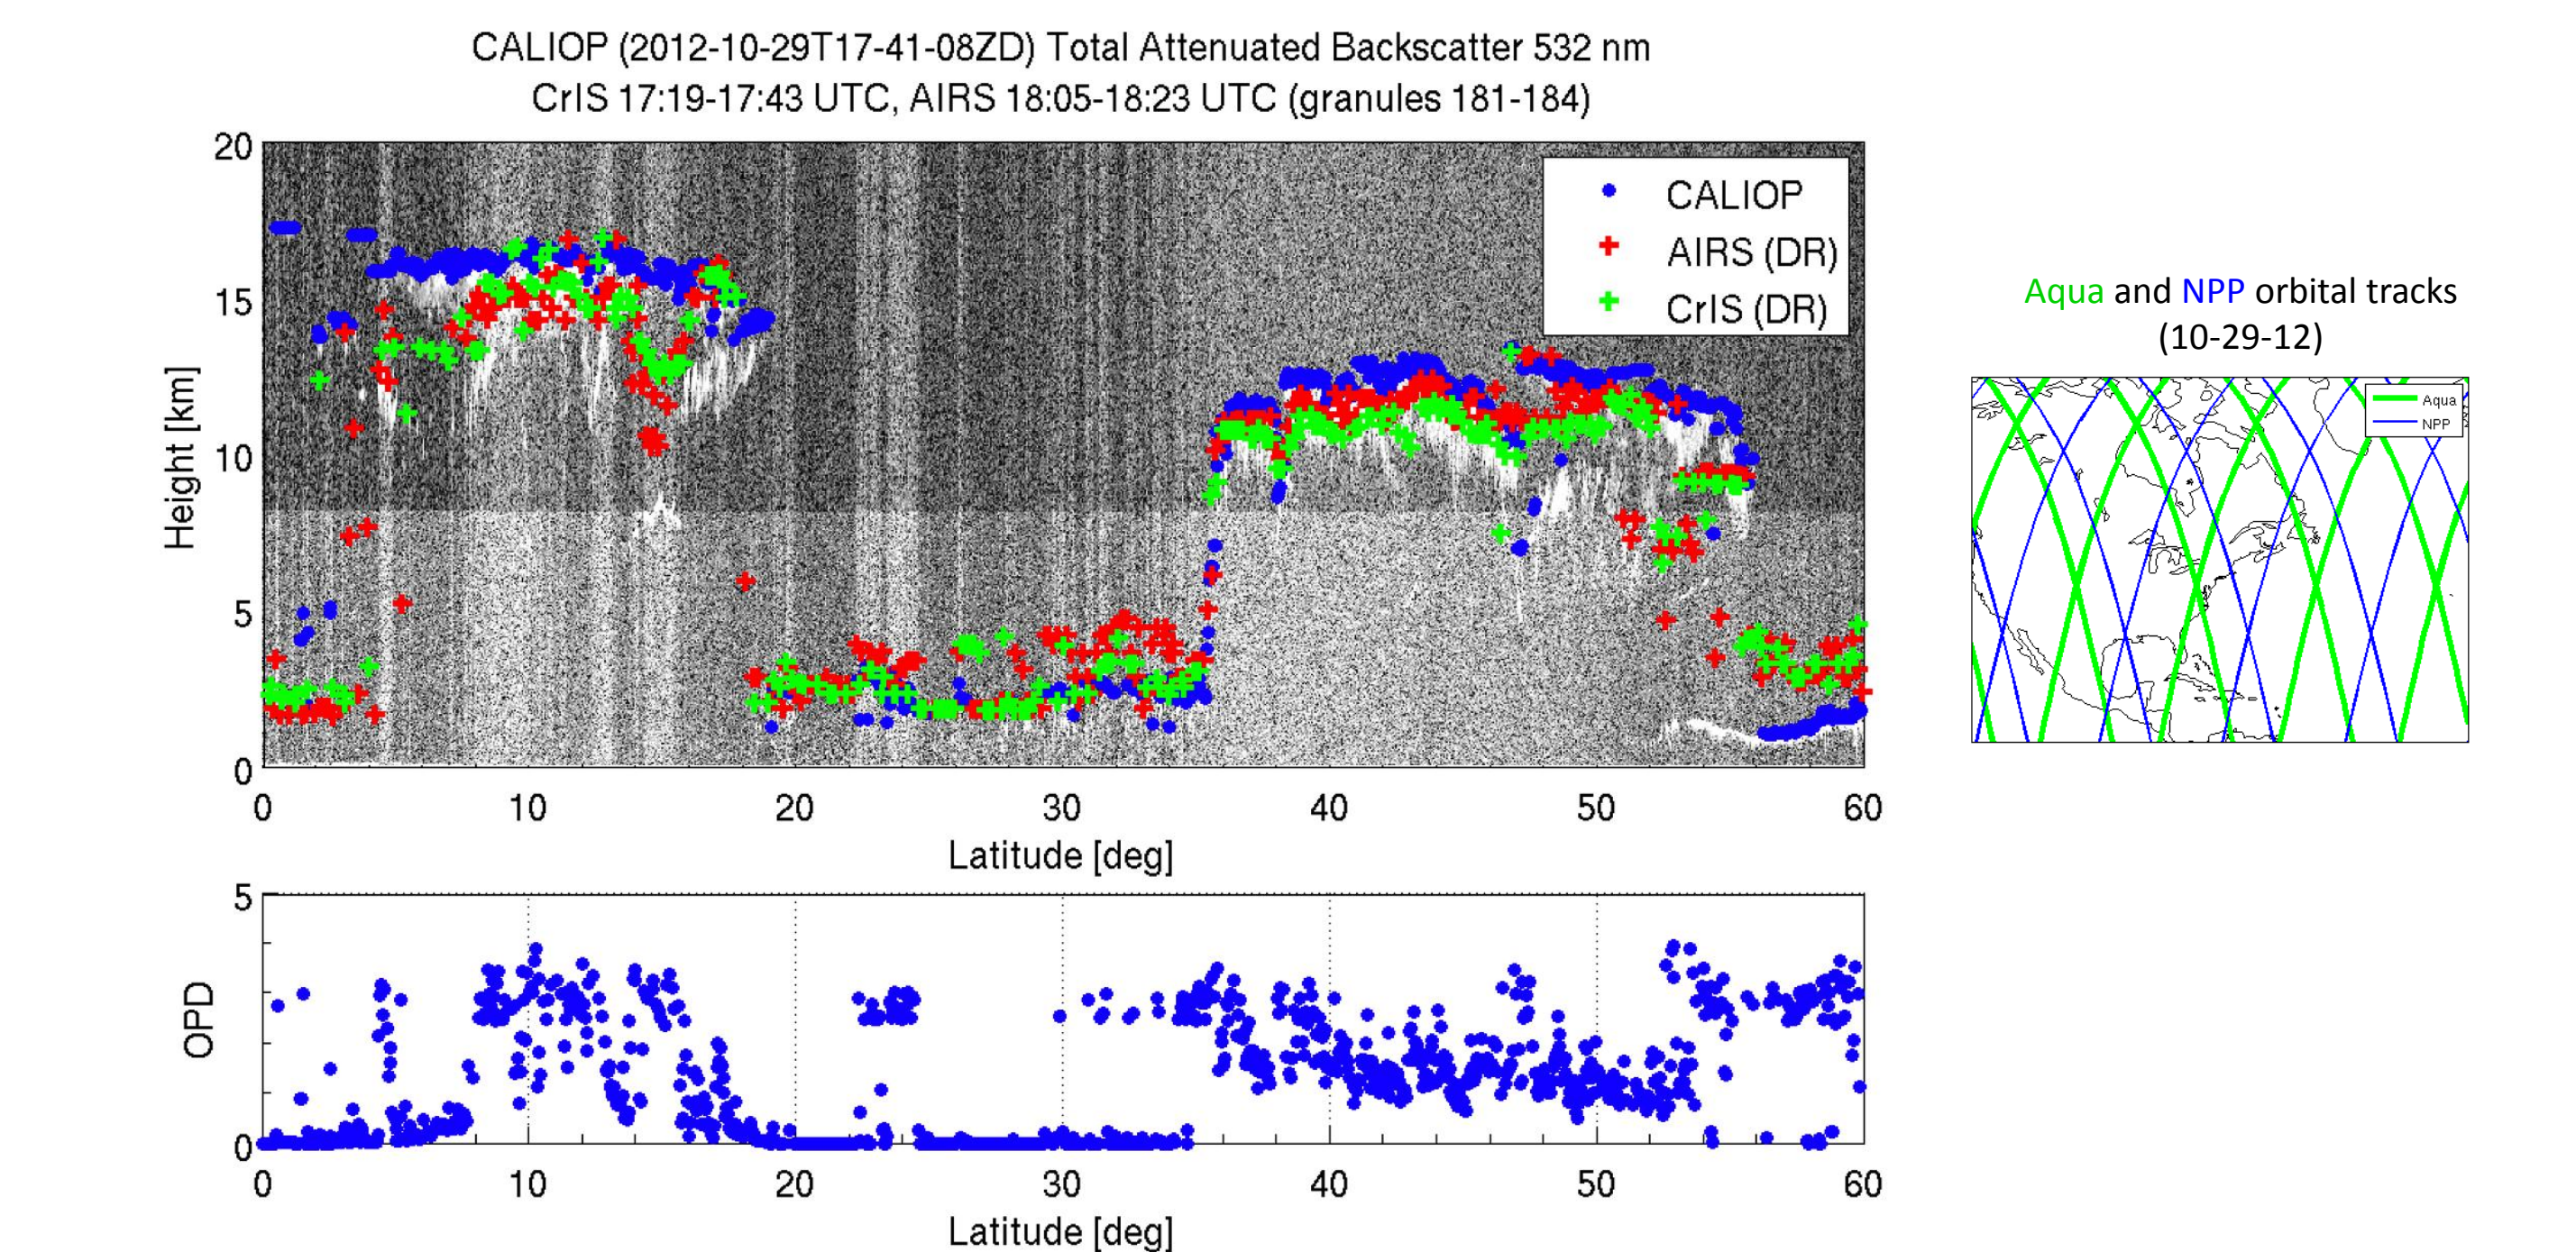

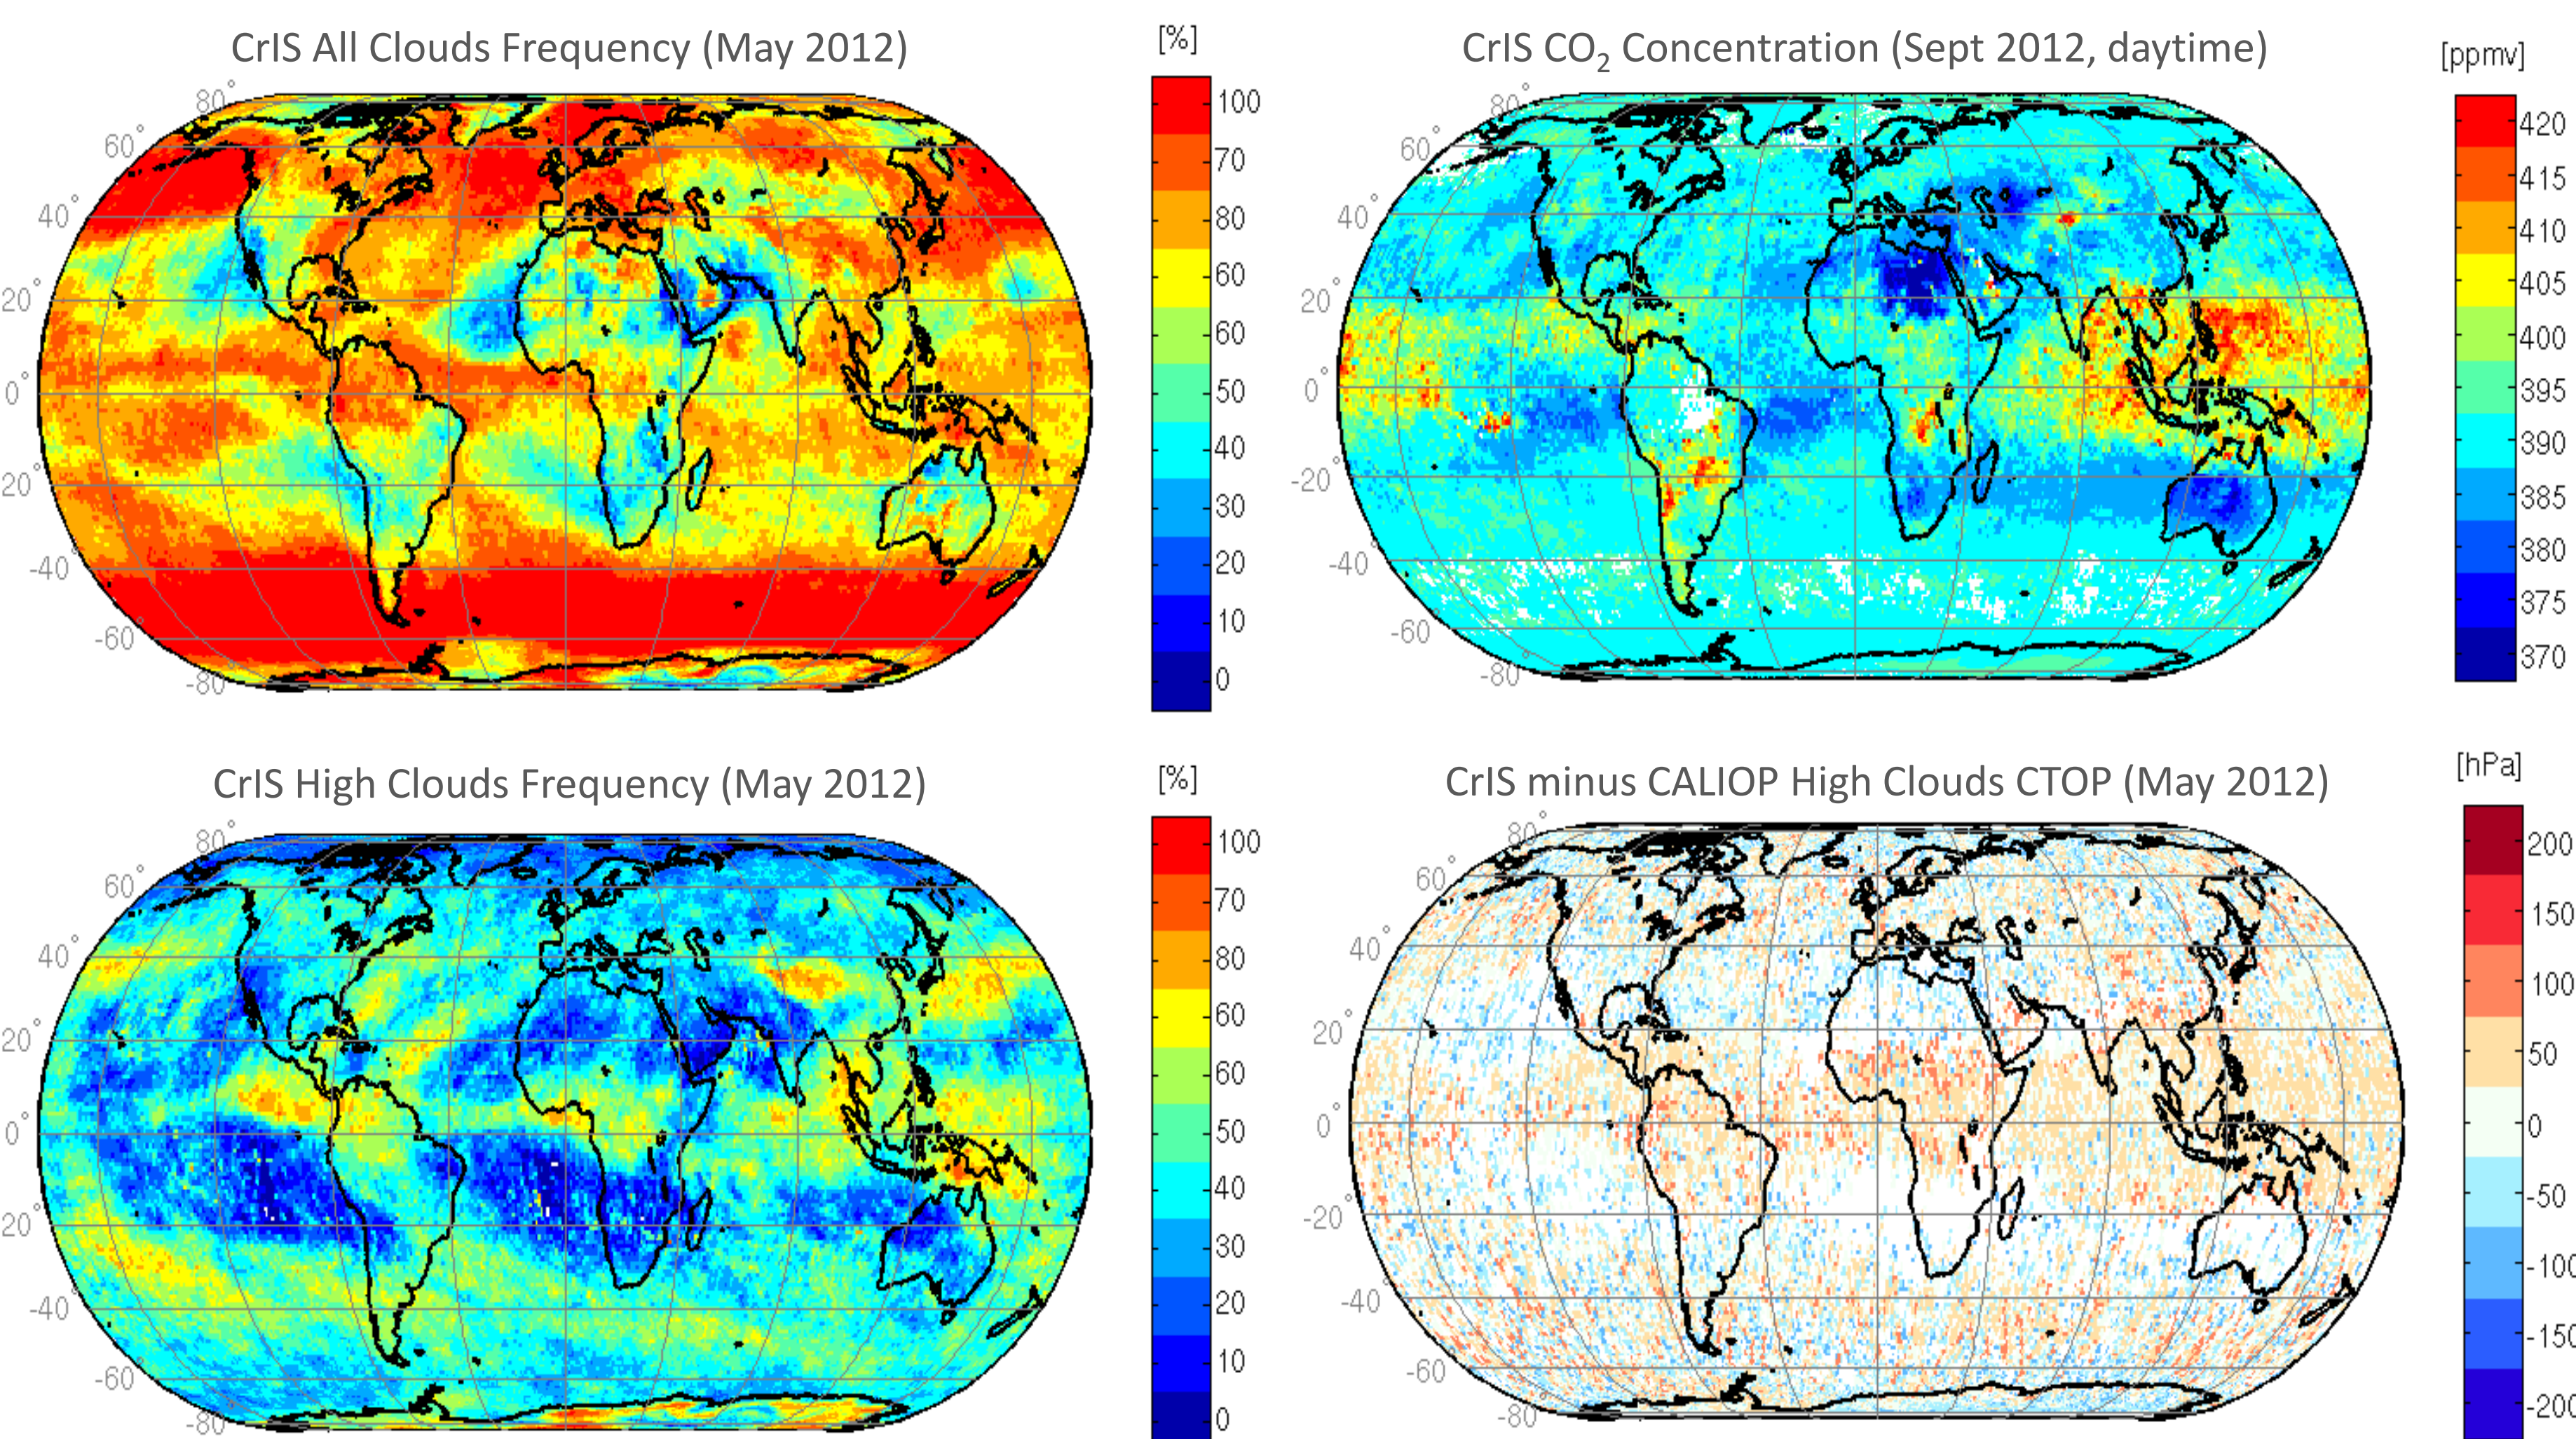

## CrIS and AIRS: Super-Storm Sandy (29 Oct 2012)

## IASI, CrIS, AIRS: Parameter Differences (01 Nov 2012)

## CrIS: Global Monthly Mean Products

**Acknowledgements.** The development of the DR processing system and its official release under CSPP was made possible through the financial support of NASA and NOAA JPSS (Joint Polar Satellite System). We acknowledge the use of MODIS data imagery from the Land Atmosphere Near-real time Capability for EOS (LANCE) system operated by the NASA/GSFC/Earth Science Data and Information System (ESDIS). CALIOP (Cloud-Aerosol Lidar with Orthogonal Polarization) data have been obtained from the Atmospheric Sciences Data Center (ASDC) at NASA Langley Research Center.
